07	CONCLUSION

1. INTRODUCTION:

Paper trading is a simulated trading activity in which participants buy and sell financial instruments using virtual money at real-time market prices. It allows learners to practise trading decisions and test ideas without risking real capital. This is a official website link: https://in.tradingview.com/

Purpose of Trading:

- To build discipline and test decision-making.
- To learn from mistakes at no financial cost.

Nature of Paper-Trading:

- Started with virtual capital of Rs.1,00,000
- The experience closely to real trading, apart from the absence of financial risk and emotional pressure.

Strategy Followed:

- Trend-Based Strategy followed consistently. (Eg: Support & Resistance line)
- Used to manage risk with exit conditions.

Period covered:

- Trading Period Starts from _____ to _____.
- This Report includes all activities to one final evaluation.

Purpose of this Final Evaluation:

- To Evaluate consistency and Trading discipline.
- To Identify Strength and Weakness.

2. PORTFOLIO OVERVIEW & PERFORMANCE EVALUATION:

Portfolio Snapshot:

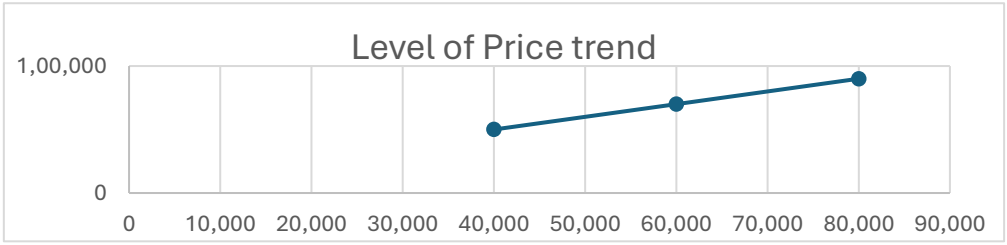

Portfolio Measure	Final Result
Total Trades	30
Closed Trades	15
Open Trades	15
Profitable Trades	12
Losing Trades	3

Portfolio Measure	Final Result
Realised P&L	-1.607.71
Unrealised P&L	0.00
Net P&L	-1.607.71

Primary Strategy Used	Trend-Based Strategy
Trading Period	

NOTE: Net PnL = Realised PnL + Unrealised PnL

Overall Portfolio Performance:

A total of 30 trades were recorded, of which 15 were opened and 15 remained closed at the end of the period. Of the closed trades, 12 were profitable and 3 were losing, giving a high win rate of 80%. However, the realised P&L was -1,607.71 and the unrealised P&L was 0.00, so the net P&L was a loss of -1,607.71.

Factors Influencing Performance:

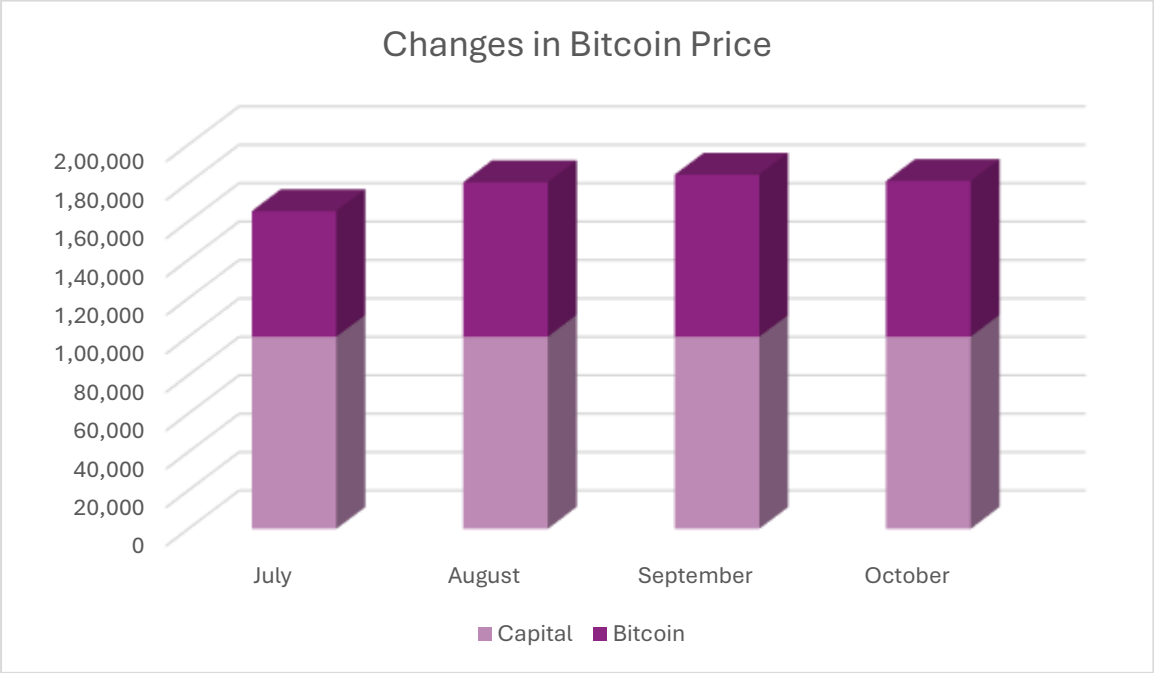

- Market Oscillation - Causing frequent reversals that pulled trades back before reaching targets and produced false indicator signals.

- Strategy Deviation - Entries were sometimes taken before full confirmation, and stop-losses were not strictly followed.

Process Vs. Outcome:

The Trading Process was partly consistent till the outcome. Started with Poor-Quality of Trade like Short Opportunities in some cases and improved with ability to manage lapses in risk.

3. TRADING STRATEGY & ITS APPLICATION:

Strategy Overview:

The primary strategy was Support and Resistance trading in range-bound or oscillating markets. Entries were taken near key support (buy) or resistance (sell) levels. After about four trades, RSI and SMA 50 were added as confirmation. Exits were made at the opposite level, with stop-losses placed just beyond the zone. Risk was limited, and later entries required confirmation.

Strategy Component	Description
Market / Trend Condition	Oscillating Market
Entry Condition	The Price level moves near Support.
Confirmation	SMA 50 helps to identify price direction and RSI helps to identify direction of momentum.

Exit Condition	Bearish Signal
Stop-loss / Risk Condition	RSI indicates risk in waiting
Other Important Condition	Skipping of Trades when Confirmation disagrees

Rationale for the Strategy:

- Why Strategy was Selected?

  Support and Resistance is easy to apply and identify at the beginning of trading.

- What I understood about the Strategy?

  Market reacts for every single action, Indicators are equally important to Line strategy to analyse the direction of price and momentum.

- What Intended market condition?

  Oscillating markets reacts at lines. (Support & Resistance)

- Why it suits paper-trading?

  Easy to follow and review, this allows to practice without financial risk.

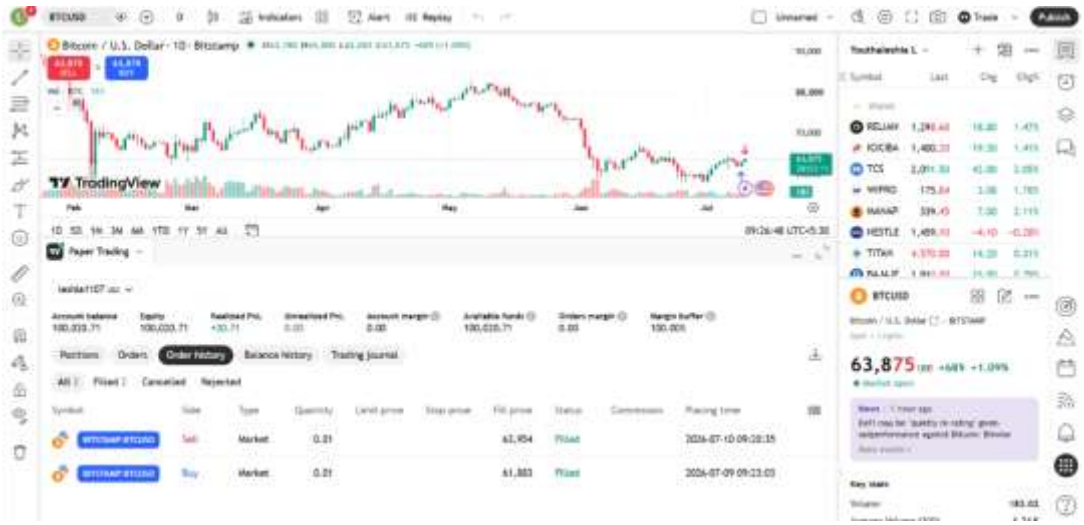

Application of the Strategy:

Strategy Required	Actually made
Confirm entries with SMA 50 and RSI 14 close. Exit on a bearish signal, and use RSI to judge the risk of waiting.	I added SMA 50 and RSI, which improved trade selection. On a few trades I didn't strictly followed Exit Signal.
Entry rules were followed well in the later trades, but exit and risk rules were applied less consistently, which explains the net loss despite the high win rate.	

Representative Trade Examples:

- **Effective Strategy Application**

Particulars	Details
Asset	Bitcoin (BTCUSD)
Trade Date	Jul 9 - Jul 10, 2026
Trade Type	Closed
Trade Setup	Price level at Resistance
Strategy Applied	Trend Based Strategy
Trade Outcome	Profit
Reason	Market supports in gaining process

➢ **Strategy Deviation / Improvement Opportunity**

Particulars	Details
Asset	Ethereum (ETHUSD)
Trade Date	Jul 30 – Aug 10, 2026
Trade Type	Closed
Trade Planned	Enter near support and to gain profit.
Actually happened	Price position did not reach the target
The Deviation / Problem	Multi signal, Indicators also added to make decision
Impact	The loss increased and implied to risk involvement
Optional made	Exit as soon as signal triggered.

4. STRATEGY CONSISTENCY & TRADING DISCIPLINE:

Strategy Consistency:

- Adherence to strategy condition – Strategy followed on most trades consistently.
- Repeated deviation - Mainly in exits and stop-loss, as in the ETHUSD trade.
- Entries – More consistent
- Exits – Less consistent
- Changes in Consistency Over Time – Entry quality improved

Trading Discipline:

- Planning - Trades were planned around support and resistance levels, and the plan improved when SMA 50 and RSI were added.
- Patience - Patience improved over time, as trades were skipped when confirmations disagreed.
- Execution - Entries were executed well, but exits were not always applied as planned.
- Emotional control – Avoided taking decisions in FOMO.
- Willingness to review and learn – Gaining knowledge with lossed trade.

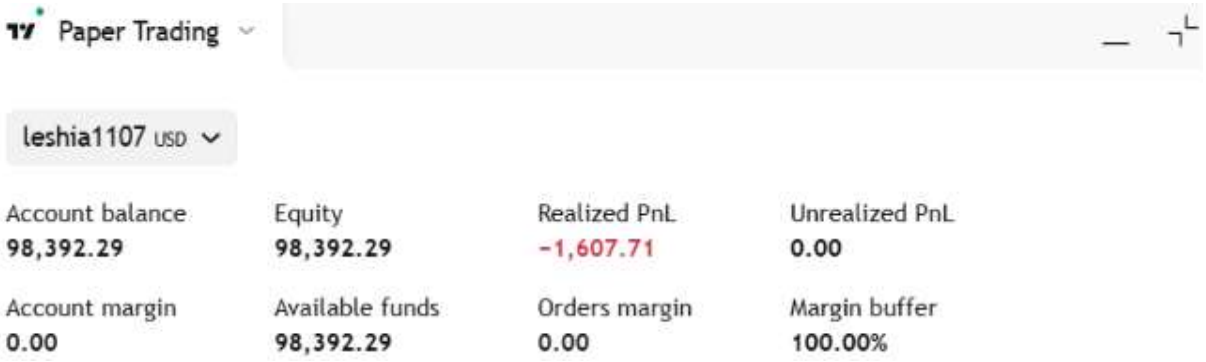

5. PERFORMANCE EVALUATION & IMPROVEMENT:

Overall Strengths:

- **Market Support**
  - Strength – Trades were entered only when price, trend and buyers supported the direction.
  - How it demonstrated – "Wait until the market supports" was a repeated in most of the trades.

- **Account Balance**
  - Strength – Capital was protected, with no major loss and the account balance kept supporting to buy the asset.
  - How it demonstrated – The account balance was checked before trading, and losses were kept small compared with the profits.
  - Evidence

Areas for Improvement:

- **Early Exits**

  - Weakness – Trades were closed before the planned exit or before the market had finished moving.
  - How it demonstrated – Profits were cut short.
  - Whether is occurred repeatedly – Yes, several times.

- **Emotion Imbalance**

  - Weakness – Decisions were influenced by FOMO during sudden price falls and sideways markets.
  - How it demonstrated – Plans made with conflicting signals.
  - Whether is occurred repeatedly – Partly, mainly in downtrends and sideways markets.

Improvement across the Programme:

- What improved – Entry quality and planning improved after confirmation was added.
- Mistakes reduced or avoided – Entering without confirmation.
- Behaviours that became more consistent – Planning trades before entry and following the plan.
- What still requires attention – Early exits, switching strategies, and patience in sideways or falling markets.

Key Performance Patterns:

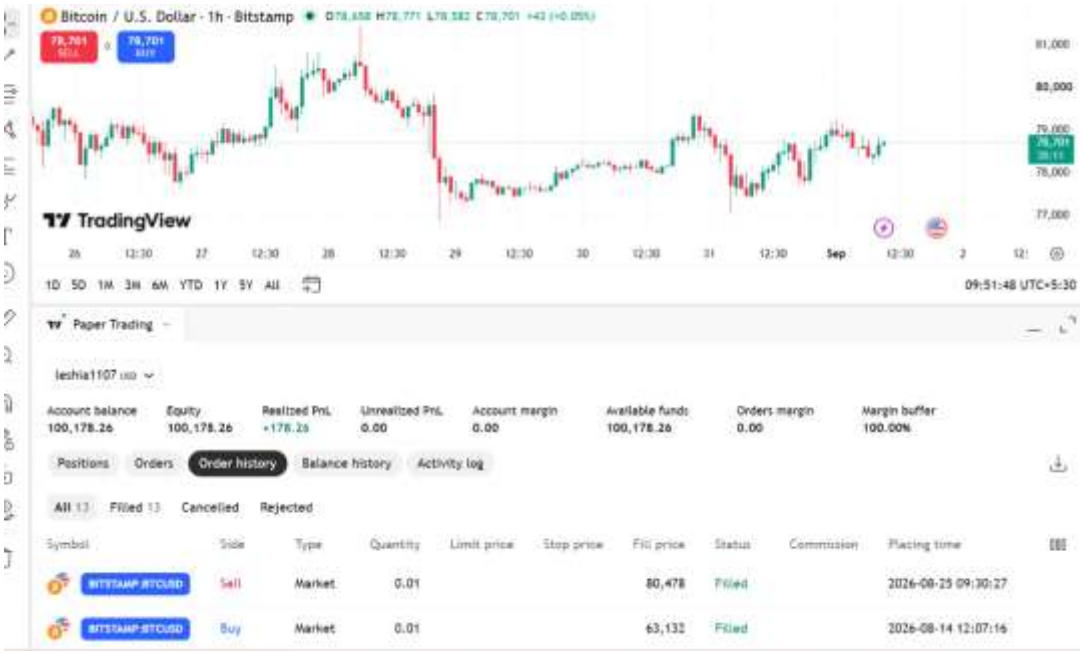

- *Confirmation and trend support gave stronger results* - Uptrend trades were profitable and downtrend trades lost.
- *Sudden reversals after rises* - Price often dropped and moved sideways after a rise, so sideways markets are a risk.
- *Early exit limits profit* - Trades held to the plan earned more

Overall Evaluation:

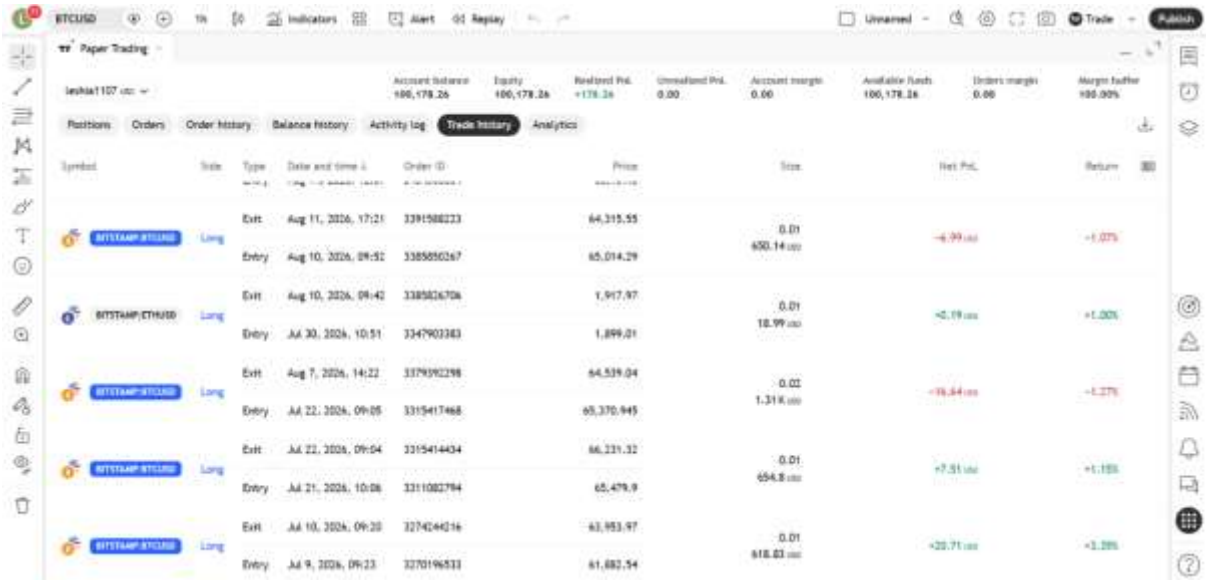

The trading process improved from unplanned entries to confirmed, trend-based trades. Entry quality was the main strength, while early exits and emotional decisions in sideways markets were the main weaknesses. The key learning is to wait for confirmation, follow the exit plan and avoid sideways markets.

6. SUPPORTING PORTFOLIO EVIDENCE

Required Evidence:

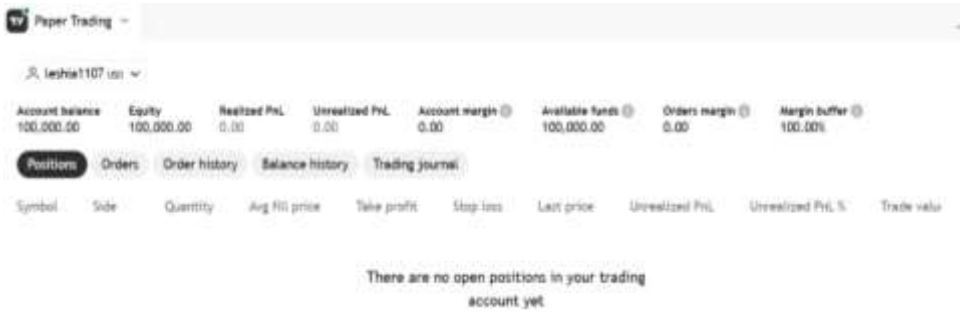

Account Summary:

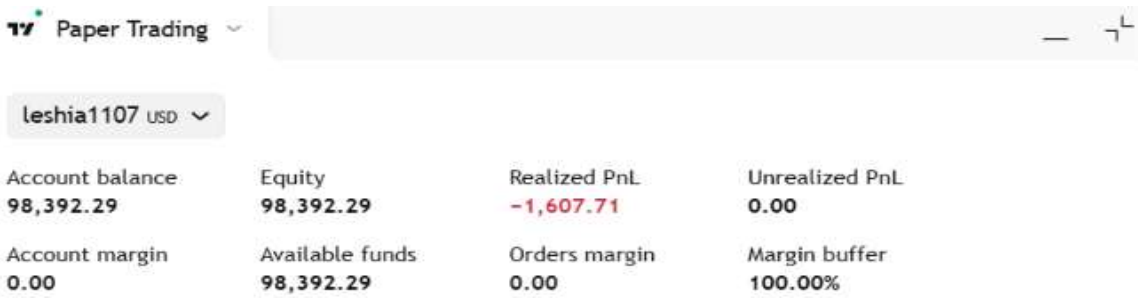

Account History:

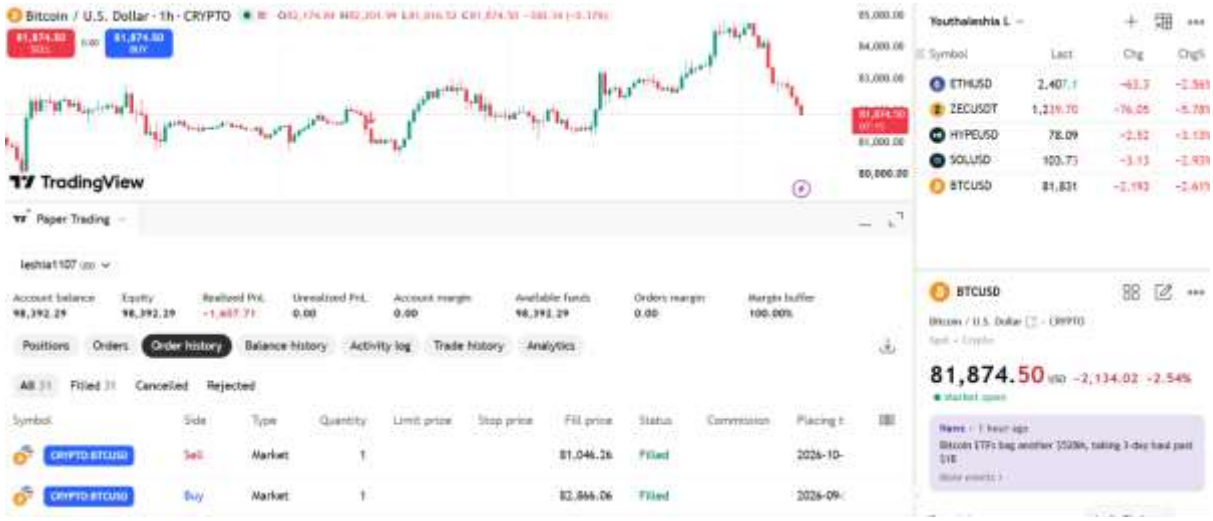

Then:

Now:

Optional Supporting Evidence – Position / Order History

7. CONCLUSION:

Portfolio performance with available balance 98,392.29. The combined strategy worked when applied with confirmation, but exits and sideways markets exposed weak discipline. Entries improved clearly. The key learning is to wait, confirm and follow the plan.

- **Portfolio performance:** The portfolio closed with a net loss of -1.607.71, and capital was largely protected, with small losses and a stable account balance.
- **Strategy Application:** The Support and Resistance approach became a combined strategy with SMA 50 & RSI Indicators, which helps to make discipline execution.
- **Consistency:** Entries became more consistent after confirmation was added, but exits and strategy switching remained inconsistent.
- **Discipline:** Planning and avoiding earlier mistakes improved.
- **Improvement:** The process moved from unplanned trades to planned, confirmed one.
- **Key Learning:** Wait for confirmation, follow the exit plan and avoid trading sideways markets.
